

KENYA FLOOD SUSCEPTIBILITY

Flood Susceptibility Zones

- Very Low
- Low
- Moderate
- High
- Very High

Data Sources:

- SRTM DEM
- CHIRPS Rainfall
- ESA WorldCover
- Google Earth Engine

Flood susceptibility was modelled using elevation (35%), slope (30%), and rainfall (35%). Low elevation, gentle slope, and high rainfall were assigned higher susceptibility. The first model included distance to water, but it was removed after QGIS QA showed circular artefacts. Classes were divided using quantiles into Very Low, Low, Moderate, High, and Very High. High coastal susceptibility is mainly linked to low elevation, flatter terrain, and rainfall influence. This map shows relative susceptibility, not observed flood extent
